Adam Abu Adas

647-860-1337 | adamabuadas@gmail.com | github.com/adam-does-code

Technical Skills

Languages: Python, SQL (MySQL), DynamoDb, JavaScript/TypeScript, HTML/CSS, Elixir
Frameworks & Libraries: React, Redux, React Flow, Cypress, Vitest, Storybook, FastMCP, Phoenix, LangChain, RAG
Developer Tools: Git, Docker, CircleCI, Terraform, Grafana, Kafka, Datadog, Arize, Claude Code, Segment

Experience

Software Engineer II

PagerDuty, Toronto, ON/Remote — *July 2022 – August 2026*

- Integral part of the PD Advance team shipping AI features and helping support other teams build their own agents
- Re-architected our AI capabilities around status updates in collaboration with the MLE team, including adding multi-turn edits and AI refinements for internal/external status templates transforming a popular manual feature into an automated one, and cutting time-to-first-customer-update
- Built and maintained LLM endpoints, extended the orchestrator agent to support new tools, and developed an LLM-as-a-judge evaluation framework
- Reduced the 70 upfront tools in PagerDuty's MCP down to a single search/execute tool, ranking candidate tools via BM25 against each tool's name, description, and input args, cutting context bloat by ~60% while maintaining 86% tool selection accuracy.
- Investigated telemetry gaps in our PagerDuty MCP with the product team, and proposed and implemented a full-fledged telemetry layer surfacing 8 previously invisible data points (e.g., tool calls, session/account IDs, auth type, tool failures) enabling the team to identify which tools are used most and in what combinations, and to understand typical session patterns — informing prioritization on the MCP roadmap
- Built and shared Claude Skills across the front-end org to automate the blueprint for adding Segment tracking using a standardized method, giving product easy visibility into feature adoption
- Mentored 2 junior engineers at PagerDuty through pairing and code review, helping them ramp up quickly and contribute to production code, while actively driving ideas to adopt and enhance internal AI practices in team dev huddles
- Led a project to consolidate two separate Slack notifications (incident details and AI-generated insights) into one unified notification, highlighting the problem summary, affected services, and initial AI triage
- Iteratively built out a front-end micro-repo over multiple feature cycles, giving customers a centralized place to configure settings and access controls for AI features
- Designed and executed a rating feature feeding ~100 monthly user ratings on Agentic AI responses into Arize for trace analysis
- Co-led a back-end project that processed weekly analytical data into automated summary emails, delivering MTTR/MTTA trend insights to ~16K admins and account owners

Software Engineer I

PagerDuty, Toronto, ON/Remote — *May 2021 – June 2022*

- Worked across the stack on features such as Service Graph, Service Standards and custom fields on incidents
- Helped run computer club sessions for 3 new senior engineers, covering architecture and an overview of every service, along with common incidents and runbooks to watch for, helping bring them to on-call readiness.

Community Engagement & Volunteer Experience

Co-Organizer | *!!Con West, Santa Cruz, California* — August 2018 – March 2020
Speaker | *PyGotham, NYC, NY* — October 2019
Poster Presenter | *PyCon US, Cleveland, Ohio* — May 2019
Speaker | *PyCon CA, Toronto, Ontario* — November 2018

Education

Bachelor of Computing, Software Engineering (Co-op) — *2016 – 2021*
University of Guelph, Guelph, ON
